

Rainwater tank in Günzburg

In Günzburg at Ulm, Germany a rainwater tank was constructed in September 2000. Here Formtex® was used to minimise growth conditions for algae. Furthermore a strong and resistant surface was needed to avoid the penetration of aggressive elements.

Figure 1. The casting of the west wall.

Process

Figure 2. Casting of the west wall.

Formtex® was used for this project - the liner was used twice.

Follow-up

Figure 3. The concrete is vibrated and the water escapes under the formwork.

For fixing the Formtex® the tensioning method was used as the elements were of a fit dimension.
